this volume summarises and reviews the enormous progress made over the past two decades in solid acids and bases with emphasis on fundamental aspects and chemical principles in recent years many new kinds of solid acids and bases have been found and synthesized the surface properties in particular acidic and basic properties and the structures of the new solids have been clarified by newly developed measurement methods using modern instruments and techniques the characterized solid acids and bases have been applied as catalysts for diversified reactions many good correlations being obtained between the acid base properties and the catalytic activities or selectivities recently acid base bifunctional catalysis on solid surfaces is becoming a more and more important and intriguing field of study it has been recognized that the acidic and basic properties of catalysts and catalyst supports play an important role in oxidation reduction hydrogenation hydrocracking etc the effect of the preparation method and the pretreatment conditions of solid acids and bases on the acidic and basic properties the nature of acidic and basic sites and the mechanism regarding the generation of acidity and basicity have been elucidated experimentally and theoretically on the basis of the accumulated knowledge of solid acids and bases it is now possible to design and develop highly active and selective solid acid and base catalysts for particular reactions the chemistry of solid acids and bases is now being related to and utilized in numerous areas including adsorbents sensors cosmetics fuel cells sensitized pressed papers and others the information presented in this book will therefore be of interest to a wide ranging readership

this book seeks to enhance our understanding of acids and bases by reviewing and analysing their behaviour in non aqueous solvents the behaviour is related where possible to that in water but correlations and contrasts between solvents are also presented

examines the properties of acids and bases where these compounds are found and how they interact with chemicals

discusses acids bases and alkalis and how they are used

many chemists and biochemists require to know the ionization constants of organic acids and bases this is evident from the science citation index which lists the determination of ionization constants by Albert and E. P. Serjeant 1971 as one of the most widely quoted books in the chemical literature although ultimately there is no satisfactory alternative to experimental measurement it is not always convenient or practicable to make the necessary measurements and calculations moreover the massive pK compilations currently available provide values for only a small fraction of known or possible acids or bases for example the compilations listed in section 1.3 give pK data for some 6 000 8 000 acids whereas if the conservative estimate is made that there are one hundred different substituent groups available to substitute in the benzene ring of benzoic acid approximately five million tri substituted benzoic acids are theoretically possible thus we have long felt that it is useful to consider methods by which a pK value might be predicted as an interim value to within several tenths of a pH unit using arguments based on linear free energy relationships by analogy by extrapolation by interpolation from existing data or in some other way this degree of precision may be adequate for many purposes such as the recording of spectra of pure species as anion neutral molecule or cation for selection of conditions favourable to solvent extraction and for the interpretation of pH profiles for organic reactions
