this is the second book of a two volume textbook on real analysis both the volumes analysis i and analysis ii are intended for honors undergraduates who have already been exposed to calculus the emphasis is on rigor and foundations the material starts at the very beginning the construction of number systems and set

theory analysis i chaps 1 5 then on to the basics of analysis such as limits series continuity differentiation and riemann integration analysis i chaps 6 11 on euclidean spaces and analysis ii chaps 1 3 on metric spaces through power series several variable calculus and fourier analysis analysis ii chaps 4 6 and finally to the lebesgue integral analysis ii chaps 7 8 there are appendices on mathematical logic and the decimal system the entire text omitting some less central topics is taught in two quarters of twenty five to thirty lectures each

this is part two of a two volume book on real analysis and is intended for senior undergraduate students of mathematics who have already been exposed to calculus the emphasis is on rigour and foundations of analysis beginning with the construction of the number systems and set theory the book discusses the basics of analysis limits series continuity differentiation riemann integration through to power series several variable calculus and fourier analysis and then finally the lebesgue integral these are almost entirely set in the concrete setting of the real line and euclidean spaces although there is some material on abstract metric and topological spaces the book also has appendices on mathematical logic and the decimal system the entire text omitting some less central topics can be taught in two quarters of 25 30 lectures each the course material is deeply intertwined with the exercises as it is intended that the student actively learn the material and practice thinking and writing rigorously by proving several of the key results in the theory

the purpose of this textbook is to present an array of topics in calculus and conceptually follow our previous effort mathematical analysis i the present material is partly found in fact in the syllabus of the typical second lecture course in calculus as offered in most italian universities while the subject matter known as calculus 1 is more or less standard and concerns real functions of real variables the topics of a course on calculus 2 can vary a lot resulting in a bigger flexibility for these reasons the authors tried to cover a wide range of subjects not forgetting that the number of credits the current programme specifications confers to a second calculus course is not comparable to the amount of content gathered here the reminders disseminated in the text make the chapters more independent from one another allowing the reader to jump back and forth and thus enhancing the versatility of the book on the website calvino polito it canuto tabacco analisi 2 the interested reader may find the rigorous explanation of the results that are merely stated without proof in the book together with useful additional material the authors have completely omitted the proofs whose technical aspects prevail over the fundamental notions and ideas the large number of exercises gathered according to the main topics at the end of each chapter should help the student put his improvements to the test the solution to all exercises is provided and very often the procedure for solving is outlined

the second volume of this introduction into analysis deals with the integration theory of functions of one variable the multidimensional differential calculus and the theory of curves and line integrals the modern and clear development that started in volume i is continued in this way a sustainable basis is created which allows the reader to deal with interesting applications that sometimes go beyond material represented in traditional textbooks this applies for instance to the exploration of nemytskii operators which enable a transparent introduction into the calculus of variations and the derivation of the euler lagrange equations

the second volume expounds classical analysis as it is today as a part of unified mathematics and its interactions with modern mathematical courses such as algebra differential geometry differential equations complex and functional analysis the book provides a firm foundation for advanced work in any of these directions
