this book illustrates the basic ideas of regularity properties of functional equations by simple examples it then treats most of the modern results about regularity of non composite functional equations of several variables in a unified fashion a long introduction highlights the basic ideas for beginners and several applications are also included

updated throughout this revised edition contains 25 new material covering progress made in the field over the past decade

the aim of this book is to lead the reader out from the ordinary routine of computing and calculating by engaging in a more dynamic process of learning this learning by doing approach can be traced back to aristotle who wrote in his nicomachean ethics that for the things we have to learn before we can do them we learn by doing them the theory is illustrated through many relevant examples followed by a large number of exercises whose requirements are rendered by action verbs find show verify check and construct readers are compelled to analyze and organize analytical skills rather than placing the exercises in bulk at the end of each chapter sets of practice questions after each theoretical concept are included the reader has the possibility to check their understanding work on the new topics and gain confidence during the learning activity as the theory unfolds the exercises become more

complex sometimes they span over several topics hints have been added in order to guide the reader in the process this book stems from the differential calculus course which the author taught for many years the goal of this book is to immerse the reader in the subtleties of differential calculus through an active perspective particular attention was paid to continuity and differentiability topics presented in a new course of action

this book is aimed at mathematics students typically in the second year of a university course the first chapter however is suitable for first year students differentiable functions are treated initially from the standpoint of approximating a curved surface locally by a flat surface this enables both geometric intuition and some elementary matrix algebra to be put to effective use in chapter 2 the required theorems chain rule inverse and implicit function theorems etc are stated and proved for n variables concisely and rigorously chapter 3 deals with maxima and minima including problems with equality and inequality constraints the chapter includes criteria for discriminating between maxima minima and saddlepoints for constrained problems this material is relevant for applications but most textbooks omit it in chapter 4 integration over areas volumes curves and surfaces is developed and both the change of variable formula and the gauss green stokes set of theorems are obtained the integrals are defined with approximative sums expressed concisely by using step functions this preserves some geometrical and physical concept of what is happening consequent on this the main ideas of the differential form approach are presented in a simple form which avoids much of the usual length and complexity many examples and exercises are included

this book begins with the basics of the geometry and topology of euclidean space and continues with the main topics in the theory of functions of several real variables including limits continuity differentiation and integration all topics and in particular differentiation and integration are treated in depth and with mathematical rigor the classical theorems of differentiation and integration such as the inverse and implicit function theorems lagrange's multiplier rule fubini's theorem the change of variables formula green's stokes and gauss theorems are proved in detail and many of them with novel proofs the authors develop the theory in a logical sequence building one result upon the other enriching the development with numerous explanatory remarks and historical footnotes a number of well chosen illustrative examples and counter examples clarify matters and teach the reader how to apply these results and solve problems in mathematics the other sciences and economics each of the chapters concludes with groups of exercises and problems many of them with detailed solutions while others with hints or final answers more advanced topics such as morse's lemma sard's theorem the weierstrass approximation theorem the fourier transform vector fields on spheres brouwer's fixed point theorem whitney's embedding theorem picard's theorem and hermite polynomials are discussed in starred sections

the ncert books are one of the most important resources for every class 10 student the book errorless ncert solutions with 100 reasoning class 10 mathematics is exclusively written to provide best quality solutions for ncert mathematics class 10 the unique selling point of this book lies in its quality of solutions which provides 100 reasoning which is missing in most of the books and are errorless a lot of solution provide notes immediately after the solutions which provides important tips shortcuts alternative methods points to remember etc this book provides quick revision of the concepts involved along with important formulas and definitions in each chapter which would act as a refresher this is followed by the detailed solutions question by question of all the questions exercises provided in the ncert book the solutions have been designed in such a manner step by step that it would bring 100 concept clarity for the student the solutions are complete each and every question is solved inflow exactly on the flow of questions in the ncert book and errorless

computer science and applied mathematics iterative solution of nonlinear equations in several variables presents a survey of the basic theoretical results about nonlinear equations in n dimensions and analysis of the major iterative methods for their numerical solution this book

discusses the gradient mappings and minimization contractions and the continuation property and degree of a mapping the general iterative and minimization methods rates of convergence and one step stationary and multistep methods are also elaborated this text likewise covers the contractions and nonlinear majorants convergence under partial ordering and convergence of minimization methods this publication is a good reference for specialists and readers with an extensive functional analysis background

each volume includes list of members and objects of the institute except v 31 which has no list of members beginning with v 12 a list of the papers contained in preceding volumes is issued regularly with each volume
