decision analysis for management judgment is unique in its breadth of coverage of decision analysis methods it covers both the psychological problems that are associated with unaided managerial decision making and the decision analysis methods designed to overcome them it is presented and explained in a clear straightforward manner without using mathematical notation this latest edition has been fully revised and updated and includes a number of changes to reflect the latest developments in the field

decision theory and decision analysis trends and challenges is divided into three parts the first part overviews provides state of the art surveys of various aspects of decision analysis and utility theory the second part theory and foundations includes theoretical contributions on decision making under uncertainty partial beliefs and preferences the third section applications reflects the real possibilities of recent theoretical developments such as non expected utility theories multicriteria decision techniques and how these improve our understanding of other areas including artificial intelligence economics and environmental studies

the present book fmds its roots in the international conference on methods and applications of multiple criteria decision making held in mons in may 1997 a small number of contributions to that conference were selected via a refereeing procedure and retained authors were requested to include in their final version their more recent results this explains why some papers differ significantly from the original presentation the introductory paper of raynaud addresses the long range forecasts in multiple criteria decision making on the basis of a delphi process that was run before and during the congress in a second part the french author explains how he and some of his partners could find the proof of an important conjecture the iteration of a strongly monotonic choice function is not a strongly monotonic ranking function the second part of the book covers methodological aspects of decision theory the contribution of bouyssou and pirlot concerns the reformulation of classical conjoint measurement models that induce a complete and transitive preference binary relation on the set of alternatives which seem to be unrealistic when decision makers are asked to compare objects evaluated on several attributes the authors propose to consider non transitive non complete and non additive decomposable conjoint models they define properties that characterize such models
